

DownUnder GeoSolutions opens Houston Office.

DownUnder GeoSolutions has opened its fourth international office, with its newest address in Houston.

Heading up the Houston office is recently appointed Business Development Manager, David Williams.

During the early stages of his career, David was a VSP specialist with Schlumberger in their UK North Sea operation. In 1991 he opened the GX Technology London office as Regional Manager (EAME) and later moved to the GXT Houston office as the company focused on developing its imaging services business. In 2000, David joined the Norwegian startup company, VoxelVision (later acquired by Schlumberger), responsible for development and sales of the company's 3D volume interpretation system, GigaViz.

DownUnder GeoSolutions' Managing Director, Dr Mathew Lamont, says that David's impressive experience and credentials will be an asset to the DownUnder sales and marketing division. "With the launch of our suite of DUG Software to the open market, the company's focus has naturally broadened from our service base", Dr Lamont said.

Until recently DownUnder GeoSolutions' highly specialised suite of DUG Software has only been available to clients who have utilised their expertise in seismic processing and depth imaging, quantitative interpretation and integrated petrophysical services.

However due to numerous customer requests for direct access to these leading-edge tools, DownUnder GeoSolutions has commercialised their unique, proprietary quantitative interpretation workflow and released these tools to the open market.

DUG Software is an integrated suite of user-friendly tools for the oil and gas industry. "They are full-featured packages that have been freshly created to deliver everything the current market needs", says David Williams, "I am really excited about the opportunity to work with them".

The tools currently available in the DUG Software work-flow are DUG Insight which is the 2D and 3D package for seismic interpretation; DUG Well which is used for log visualisation and manipulation, Gassmann substitution and deterministic AVO modelling; and DUG Mod+ which is a complete forward modelling toolkit.
